Plasticizer for concrete foundation

Plasticizer for concrete foundation is characterized by high water reduction, high moisture retention, high reinforcement, low dosage, remarkable retardation effect and good cement adaptability. It is suitable for formulating commercial concrete, high strength concrete and flow, Concrete, self-compacting concrete and large admixture concrete.

Advantages Of Plasticizer for concrete foundation In Building Construction

At present, the use of Plasticizer for concrete foundation in construction is still relatively common, this is because its product performance can improve the building strength, improve the quality of the project, the product is green environmental protection, not flammable, not explosive, can safely use the train and automobile transportation. So in the construction has a very important role, the following is to introduce its advantages.

- 1, the alkali content and chloride ion content is very small, after the addition of polycarboxylic acid mother liquor on the steel without corrosion damage, no adverse effects on concrete. At the same time, the product in the low temperature season without salting out, no crystallization, easy to use.
2. It is conducive to improving the workability of concrete mixture, reducing water leakage, and improving the appearance quality and durability of hardened concrete, especially suitable for use in fair-faced concrete projects.
3. The concrete prepared with polycarboxylic acid water reducer mother liquor will not have obvious segregation and bleeding even under the condition of high slump, and the appearance of concrete is uniform in color. When used to prepare high-grade concrete, the concrete has good workability, good cohesion and easy mixing.

Therefore, Plasticizer for concrete foundation is very necessary for building construction, and it is generally added in proportion when used, which can not only make the project more solid but also reduce various hazards. As long as we understand the material properties and advantages, we will be able to better apply it in the later period. Plasticizer for concrete foundation is a kind of high-performance water reducer and a kind of cement dispersant in the application of cement concrete. It is widely used in highway, bridge, dam, tunnel and high-rise building.
